

Change scores in a synthetic training study

Workshop Participant^a

^a *Your University,*

Abstract

This demonstration renders a small computational analysis with a bundled Elsevier journal format. The data are synthetic and the result is illustrative.

Keywords: reproducibility, literate programming, Quarto

1. Introduction

Literate programming combines narrative and executable analysis [1]. This document demonstrates that a journal format changes presentation while the underlying calculation remains recorded in the source.

2. Results

The synthetic dataset contains 40 observations.

```
ggplot(study, aes(training_hours, change, colour = group, shape = group)) +  
  geom_point() +  
  geom_smooth(method = "lm", se = FALSE) +  
  labs(x = "Training hours", y = "Change in score") +  
  theme_minimal()
```

Figure 1: Change score by training hours and study group.

3. Discussion

The output is a formatting demonstration, not evidence about a real intervention. Journal instructions should be checked at the time of submission.
