2026-07-29

1 Introduction

This manuscript uses a synthetic training study to practise reproducible writing. Literate programming keeps explanation and computation together.

2 Methods

The dataset contains 40 fictional participants. It is stored inside the project so the document does not depend on an external download.

3 Results

```
# TODO:
# ggplot(study, aes(training_hours, change, colour = group)) +
#   geom_point(size = 2) +
#   geom_smooth(method = "lm", se = FALSE) +
#   labs(
#     x = "Training hours",
#     y = "Change in score",
#     colour = "Study group"
#   ) +
#   theme_minimal()
```

Table 1: Change scores by study group.

```
# TODO:
# summary_table <- study |>
#   group_by(group) |>
#   summarise(
#     participants = n(),
#     mean_change = mean(change),
#     sd_change = sd(change)
#   )
#
# knitr::kable(summary_table, digits = 1)
```

4 Discussion

TODO: Distinguish the descriptive result from a causal conclusion and name one limitation of the synthetic study.

5 Reproducibility

The source data, transformations, prose, and output instructions are stored in one project. The completed document records session information here.
